# Estimated Costs of Crop Production in Iowa - 2017

*Ag Decision Maker*

File A1-20

---

The estimated costs of corn, corn silage, soybeans, alfalfa, and pasture maintenance in this report are based on data from several sources. They include the annual Iowa Farm Business Association record summaries, production and costs data from the Departments of Economics, Agricultural and Biosystems Engineering, and Agronomy at Iowa State University, and a survey of selected agricultural cooperatives and other input suppliers around the state.

These cost estimates are representative of average costs for farms in Iowa. Very large or small farms may have lower or higher fixed costs per acre.

Due to differences in soil potentials, quantity of inputs used, and other factors, production costs will vary from farm to farm. Price shifts for inputs can change production costs in both the short and long run. The data reflect average cost of purchased inputs and a return to land and labor resources, but do not provide a margin for profit or a return to management. They reflect production costs only, and do not include costs of storage.

Labor has been treated as a fixed cost because most labor on Iowa farms is supplied by the operator, family, or permanent hired labor. However, when deciding among alternative crops, labor should be considered a variable cost. The wage rate used here is \$13.00 per hour. The hours assumed per crop are presented in the budgets. Hours have been adjusted downward in 2017 to reflect increased field capacity of farm machinery. ([AgDM File A3-24](#)) The hours per crop acre include not only the field work but also time for maintenance, travel, and other activities related to crop production. The land charge is based on rent equivalent. Owned land may require a greater or lesser cash outlay.

In the short run, cash income must be sufficient to pay cash costs, including seed, fertilizer, chemicals, insurance, cash rent, and hired labor, as well as machinery fuel and repairs, and interest on operating capital. In the long run, income

should be sufficient to pay all costs of production for resources to be used in their most profitable alternative.

Corn yields reflect rotation effects. Fertilizer rates have been adjusted to reflect current data on removal and application rates. Crop insurance costs reflect revenue crop protection at an 80 percent coverage level for a typical farm in Iowa.

Machinery costs reflect both new and used equipment. The machine operations assumed are based on the 2000 Crop Production Practices Survey conducted by the Iowa Agricultural Statistics Service and Iowa State University Extension and Outreach publication [PM 696](#), *Estimating the Field Capacity of Farm Machines* ([AgDM File A3-24](#)). The Estimated Machinery Costs table can be used to budget other tillage and harvesting systems.

Estimates represent typical costs and are only intended to be guidelines. Actual costs will vary considerably and can be entered in the column for "Your Estimates." Electronic spreadsheets for developing crop production budgets are available on the Ag Decision Maker website, [www.extension.iastate.edu/agdm](http://www.extension.iastate.edu/agdm).

Budgets for alfalfa hay establishment with an oat companion crop and by direct seeding are included in this publication. Annual production costs for established alfalfa or alfalfa-grass hay as well as a budget for maintaining grass pastures are included. Additional pasture establishment budgets are published in ISU Extension and Outreach publication [AG-96](#), *Estimated Costs of Pasture and Hay Production* ([AgDM File A1-15](#)).

Two low-till budgets, one for corn and one for soybeans, are included. The major differences between the low-till and conventional budgets are the preharvest machinery, labor, herbicide, and seeding costs. The soybean budgets are for herbicide tolerant varieties. A strip-till budget is also included.

<sup>1/</sup> Assumes 80 bushels oat yield, one ton straw yield, and one ton per acre alfalfa yield from one cutting.

<sup>2/</sup> Assumes two and a half tons per acre from two alfalfa cuttings with herbicide-assisted seeding.

<sup>3/</sup> Omit oats from August seedings. Higher priced seed varieties or different seed mixtures could vary these costs by 1.2 to 2.0 times.

<sup>1/</sup> For harvest as silage, use machine cost estimates from the Estimated Machinery Costs table.

<sup>2/</sup> Assumes alfalfa-grass seeded with oat companion crop. If alfalfa seeded with preplant herbicide, then use other costs (see previous page).

<sup>3/</sup> For 6-ton yield goal, a split application of fertilizer is assumed.

<sup>4/</sup> Harvest cost estimates assume 3 cuttings for 4 tons and 4 cuttings for 6 tons.

<sup>1/</sup> These are average rates and may vary with soil test and the level of management on a particular field. Different herbicide alternatives could vary this cost.

<sup>2/</sup> Improved grass pastures assume a dominance of cool season grasses such as smooth bromegrass, orchardgrass, tall fescue, or reed canarygrass.

<sup>3/</sup> Improved grass-legume pasture assumed one-third of the forage is made up of red clover, birdsfoot trefoil, or alfalfa.

## Estimated Machinery Costs

The following cost estimates are for on-farm use, excluding labor. Depreciation is based on current replacement cost; interest is based on average market rates. Fixed costs will be greater for newer machinery. If annual machine use is greater than that assumed, fixed costs per acre will be lower, and vice versa. Hauling costs are based on a round trip of one mile. Remember these are estimates and they should not take the place of accurate record-keeping. Diesel fuel is estimated to cost \$2.49 per gallon, delivered to the farm in bulk.
