Anyone who is involved with the rental market for Iowa farmland knows that rental rates were pushed significantly higher by the favorable corn and soybean prices that farmers enjoyed in 2007 and early 2008. That was followed by lower prices in late 2008 and 2009, which took much of the steam out of the land market. Prices took off again in fall of 2010 due to tight grain supplies and increased demand worldwide. It didn’t take long for those prices to be reflected in cash rents.

Results from the most recent Iowa State University Extension rental rate survey estimated that the average cash rent for corn and soybean land in the state for 2011 was $214 per acre, an increase of $30 per acre or 16 percent from last year. This is the largest one-year increase since the statewide survey was started in 1994. Even more interesting, though, was the range of typical rents reported. For most counties the lower end of the range was about the same as in 2010, but the high end of the range was as much as $50 to $100 an acre above last year. Remember, the range represents the highest and lowest estimates of typical rents for high, medium and low quality land by respondents who replied for each county. They do not represent rents for individual farms.

Average rents were higher in all nine crop reporting districts, with increases ranging from $23 per acre (12 percent) in east central Iowa to $37 per acre (21 percent) in southwest Iowa. Individual farm rents that were set before the Sept.1, 2010, termination deadline probably changed very little, while rents that were negotiated later likely reflected the higher corn and soybean prices being offered then.

The intent of the Iowa State survey is to report typical rents in force, not the highest or lowest values heard through informal sources. Rental values were estimated by asking over 3,000 people familiar with the land market what they thought were typical rates in their county for high, medium and low quality row crop land, as well as for oats, hay and pasture acres. The number of responses received this year was 1,567, an increase of 25 percent over last year. Of these, 33 percent came from farmers, 24 percent from landowners, 22 percent from professional farm managers, 14 percent from lenders, and 7 percent from other professionals.
The Cash Rental Rates for Iowa 2011 Survey is available online as a downloadable document; from the Ag Decision Maker website http://www.extension.iastate.edu/agdm/wholefarm/pdf/c2-10.pdf and from the ISU Extension online store at http://www.extension.iastate.edu/Publications/FM1851.pdf. Other resources available for estimating a fair cash rental rate include the Ag Decision Maker information files Computing a Cropland Cash Rental Rate (C2-20) http://www.extension.iastate.edu/agdm/wholefarm/html/c2-20.html and Flexible Farm Lease Agreements (C2-21) http://www.extension.iastate.edu/agdm/wholefarm/html/c2-21.html. Both documents include decision file electronic worksheets to help analyze leasing questions.

2011 ACRE enrollment deadline nears

by Steven D. Johnson, farm and ag business management specialist, Iowa State University Extension, (515) 957-5790, sdjohns@iastate.edu

Farmers nationwide have until June 1, 2011, to sign up at their USDA Farm Service Agency (FSA) office for the annual Direct and Counter-Cyclical Payment (DCP) program. This is the same deadline to also enroll in the Average Crop Revenue Election (ACRE) program.

The ACRE enrollment is optional by FSA farm number with payments triggered by state-level, crop specific revenue losses. ACRE acts in place of the price-only based Counter-Cyclical Payment (CCP). The ACRE program is a much better revenue safety net than the price-only CCP if you have a combination of yield and price that results in low state and farm revenue.

Iowa farmers have only enrolled 16 percent of their base acres in the ACRE program to-date, according to FSA data. Once a farm is enrolled in ACRE, that farm stays in the program through the 2012 crop year and the farmer gives up 20 percent of the annual direct payment and loan rates for bushels on that farm are reduced by 30 percent. In summary, farmers can enroll farms by FSA farm number in the ACRE program and receive revenue protection based on a state-level, crop specific revenue guarantee.

Will Iowa farmers enroll additional farms in the 2011 ACRE program?

The probability of collecting a 2011 ACRE payment in Iowa seems remote based on current price forecasts for the 2011-12 marketing year which begins Sept. 1.

In February 2011, USDA projected the national average cash price for corn would be $5.60 per bushel and $13 per bushel for soybeans. These numbers could be updated in the May 11, 2011 USDA World Ag Supply and Demand Estimates (WASDE) report. With continued tight U.S. ending stocks forecast for both 2011 corn and soybean crops, ACRE payments in Iowa will be hard to trigger.

The 2011 ACRE projected revenue guarantee for corn in Iowa is expected to be $645 per acre. This uses a 169 bushel per acre average for the 5-year Olympic average yield times the 2-year average cash price of $4.48 per bushel times 90 percent. However, the state trigger can’t change by more than 10 percent from the 2010 guarantee which was $586.36 per acre. Thus, the 2011 projected guarantee is limited to no more than $58.64 per acre more than the $586.36 per acre 2010 revenue guarantee.

Using the 2011 ACRE revenue projected guarantee of $645 per acre, a combination of a low state yield and a low national average cash price would be needed to trigger a 2011 ACRE payment at the state level. Since Iowa is the largest corn producing state, the chance of this occurring isn’t likely.

Corn Example: Suppose in 2011, Iowa produces a final state corn yield equal to the 5-year Olympic average yield of 169 bushel per acre. The national average cash price for the 2011 crop would have to drop below $3.81 per bushel ($645/A divided by 169 bu/A) to trigger an ACRE payment at the state level. In February 2011 USDA forecast a national average cash price of $5.60 per bushel for the 2011-12 marketing year.
Collecting a 2011 ACRE payment for soybeans is possible but not likely. The 2011 Iowa revenue guarantee increases to $479.50 per acre for beans using a 50.5 bushel per acre average for the 5-year Olympic average yield times a 2-year simple average cash price of $10.55 per bushel times 90 percent.

**Soybean Example:** Suppose in 2011, Iowa produces a final state soybean yield equal to the 5-year Olympic average state bean yield of 50.5 bushel per acre. The national average cash price for the 2011 marketing year would have to drop below $9.49 per bushel ($479.50/A divided by 50.5 bu/A). In February 2011 USDA forecast a national average cash price of $13 per bushel for the 2011-12 marketing year.

The potential for 2011 ACRE payments seems limited, especially in Iowa which leads the nation in both corn and soybean production. Should Iowa have a 2011 final state yield that is below the 5-year Olympic average yield, the likelihood is national prices would be higher. Thus, with tight U.S. ending stocks forecast for the 2011-12 crop marketing year, the probability of triggering 2011 ACRE payments seems quite low.

**Financial management with high prices**

*by William Edwards, extension economist, 515-294-6161, wedwards@iastate.edu*

Rarely do Midwest agricultural producers see above average prices for both grains and livestock at the same time. Even though prices of feed, seed and fertilizer are also at historical highs, many farm families will find themselves with more than the usual amount of cash left over in 2011.

Much has been written about financial management strategies when times are tough. In reality, the most important financial decisions are often made when times aren’t so tough. As one ag lender said, “Most bad loans are made in good times.” So how can farmers position themselves for the inevitable downturn?

**Replace assets.** Updating the machinery line and replacing equipment now will lower cash flow requirements in the future. It is possible to “live off depreciation” when margins get tighter. But don’t invest in larger machinery unless you really need the extra capacity. And use equity dollars as much as possible.

**Expand cautiously.** Many farmers want to invest extra cash in land, but when everyone is looking to buy, prices rise rapidly. Buying land with 50 percent or more equity will help ensure that the payments will cash flow even under lower prices. The same holds true for livestock facilities. Highly leveraged expansion projects during high price periods often come on line just in time for lower selling prices. Borrowing to grow the business is acceptable, but keep the ratios in line.

**Improve efficiency.** Look for ways to invest in cost-saving technology. Innovations like automatic guidance systems and seed shut-offs save money in the long run. Improved feeding systems can cut waste and lower costs of gain.

**Reduce debt.** Look for the highest interest rate loans you have, and see if there is any penalty for prepaying principle. Reducing debt provides a guaranteed return on your investment, and leaves equity available for borrowing again in the future.

**Fix interest rates.** Current interest rates are low by historic standards. The small penalty charged for a fixed rate could look like a bargain in a few years.

**Forward price production.** Many grain producers who forward priced their products in 2010 felt cheated when prices soared at harvest time. But that was an exceptional year. Tight supplies could possibly lead to even higher prices, but you don’t have to hit a home run if you get enough singles and doubles. Don’t overlook opportunities to forward price livestock, too. Livestock Gross Margin and Livestock Revenue Pro-
tion insurance are available for cattle, hogs, lambs and milk at a relative low cost through your crop insurance provider.

**Negotiate a flexible lease.** Incorporating both actual yields and prices into a formula used to set the cash rent each year will automatically reduce costs when revenues decline, while fixed cash rents may take several years to react. And the landowner can still benefit from higher returns. Avoid locking in high rents for multiple years unless you can price your product for the same period.

**Diversify assets.** You don’t have to limit yourself to agriculture. There may be bargains available in non-farm real estate or retail ventures. Or mutual funds can return a steady income at a level of risk that you are comfortable with.

*Selling your crop insurance bushels*

*by Steven D. Johnson, farm and ag business management specialist, Iowa State University Extension, (515) 957-5790, sdjohns@iastate.edu*

The March 15 deadline for making 2011 federal crop insurance decisions has passed. Farmers can still add coverage options such as hail or wind. With record new crop corn and soybean prices being offered this spring, consider combining your crop insurance coverage with a pre-harvest marketing strategy and the delivery of bushels.

**Crop insurance as a risk management tool**

Most farms utilize a crop insurance product that provides a revenue guarantee on a percentage of their actual production history (APH). The most common product used by Iowa farmers in 2011 will likely be Revenue Protection (RP). In speaking with many crop insurance agents, many farmers “bought up” coverage this year to the 80 percent or 85 percent levels.

The decision to increase the coverage level could have been in combination with the use of enterprise units to save on premium. There is a greater risk if you elect enterprise units, since you decrease your chances of collecting an indemnity. That’s because you combine all your farms together by crop across the county for determining loss.

Using policies such as Revenue Protection (RP) or Revenue Protection with the Harvest Price Exclusion (RPE) guarantee both yield and price using farm level APHs. However, RPE does not offer a higher harvest guarantee should the harvest price (futures price average in October) be higher than the projected price (futures price average in February).

The Yield Protection (YP) is also a farm-level product, but does not trigger an indemnity unless a yield loss first occurs. The indemnity for both RPE and YP are limited to the projected price only.

**Pre-harvest marketing strategies**

The 2011 projected price is $6.01 per bushel for corn and $13.49 per bushel for soybeans, respectively. Use of RP or RPE guarantees the farm’s APH times the level of coverage. These are often referred to as the guaranteed bushels or the farm’s insurance bushels.

Let’s use an example to understand how the Revenue Projection (RP) product works. Say your farm’s average APH is 160 bu/A and you elect the 75 percent level of coverage; your guaranteed bushels are 120 bu/A. To calculate the revenue guarantee you simply multiply the guaranteed bushels (120 bu/A) times the projected price of $6.01/bu. to get $721/A.

Using RP in 2011 should provide a comfort level in selling bushels for delivery on a portion of your
guaranteed bushels. Should a natural peril like drought, flood or hail occur; any shortfall in bushels below the 120 bu/A should trigger an indemnity payment calculated at the $6.01/bu projected price.

**Shortfall in harvest yield**

Now the proverbial question: “What if I don’t raise those bushels that I’ve committed to delivery?” Use the example and understand that the harvest yield estimated was only 100 bu/A, but your guaranteed bushels were 120 bu/A. Your indemnity will simply reflect those missing 20 bu/A times $6.01/bu or $120.20/A. If you’d committed all 120 bu/A to delivery, you’ll still need to work with your grain merchandiser to “buy back” those extra bushels.

Many times there will simply be a charge of 10 to 20 cents per bushel since other merchandiser bushels can be substituted for your shortfall. Since you’ll be collecting an indemnity payment following harvest reflecting $6.01/bu, the ability to “buy back” bushels is negated. Should the harvest price (futures price average in October) be less than the futures price that you contracted bushels for delivery, the “buy back” will be even less and reward your pre-harvest marketing strategy.

Note this indemnity reflects a futures price average, which is to your advantage. That’s because the futures prices in most Corn Belt locations tend to be higher than the cash price used for “buy back” bushels. This is especially true at harvest when the basis (cash minus futures) tends to be the widest.

**Revenue guarantee vs. harvest guarantee**

Where many farms struggle in utilizing crop revenue coverage and pre-harvest marketing of bushels for delivery is the ability to recalculate the revenue guarantee. The example includes two extreme harvest price estimates. The high harvest price is $8/bu and generates an indemnity of $160/A. The low harvest price is $4/bu but creates a much larger Indemnity totaling $321/A. That’s because in the example, the actual harvest yield is multiplied times the higher of the projected or harvest price to create the calculated revenue. To determine the indemnity, subtract the calculated revenue from the harvest guarantee.

The $8/bu harvest price estimates allow for a new harvest guarantee to be calculated, since $8/bu is higher than the $6.01/bu projected price. Note this calculation is not available for the RPE product, since you have an exclusion on the harvest price.

**Selling guaranteed bushels**

The key is the indemnity for any shortfall in bushels uses the projected price and has a minimum of the $6.01/bu. The advantage of the RP over RPE is that should the harvest price be greater than the projected price, a new harvest guarantee is calculated.

If you choose to pre-harvest sell bushels for delivery, consider timing those sales when December corn futures or November soybean futures are higher than the projected price. This way you’re guaranteed that if you come up short of bushels, you can collect a minimum of $6.01 per bushel for corn or $13.49 per bushel for soybeans, respectively.

**Conclusion**

The use of crop insurance revenue products such as Revenue Protection (RP) can easily be used in combination with a pre-harvest sales strategy that commits guaranteed insurance bushels to delivery.

Use of forward contracts and hedge-to-arrive contracts are common tools for selling these bushels. It’s still important to understand how to use a variety of marketing tools. For bushels that you prefer not to commit to delivery, consider protecting the futures price with tools such as futures hedges and/or buying put options.
