Biofuels impacts: Processing database update

During the 2009-2010 project year, we intend to continue to update the databases for corn processing and soybean processing that were started in 2006 within the IGQI. These databases presently include processing facilities for food and fuel production. This year, Iowa feed mills will be added as they are significant users of Iowa corn and soybeans, as well as distillers grains and soybean meal. Other organizations also tracking this type of data (DOT, IDALS, and others) will be asked to join in support of a unified database for use in many applications.
